Used in Pulmonary Embolism (PE) to initiates fibrinolysis.
-1- SIMILARITY: BELONGS TO PEPTIDASE PAMILY S1.
-1- SIMILARITY: Contains 1 Kringle domain.
-1- SIMILARITY: Contains 1 EGF-like domain.

Submitted (APR-1992) to the EMBL/GenBank/DDBJ databases.
--CATALYTIC ACTIVITY: Specific cleavage of Arg-|-Val bond in plasminogen to form plasmin.
--SUBMINIT: POUND IN HIGH AND LOW MOLECULAR MASS FORMS. EACH CONSISTS OF TWO CHAINS, A AND B. THE HIGH MOLECULAR MASS FORM CONTAINS A LONG CHAINS, A SUBMINIT: PASS FORM TO YIELD A SHORT AI CHAIN (BY SIMILARITY).
---SIMILARITY: BELONGS TO PEPTIDASE FAMILY SI.
----SIMILARITY: Contains I EGF-like domain.

-! CATALYTIC ACTIVITY: Specific cleavage of Arg-|-Val bond in plasminogen to form plasmin.

-! INDUCTION: By retinoic acid.

-! SIMILARITY: BELONGS TO PEPTIDASE FAMILY S1.

-! SIMILARITY: Contains 1 kringle domain.

-! SIMILARITY: Contains 1 BGP-like domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    "Bovine urokinase-type plasminogen activator and its receptor: cloning and induction by retinoic acid.";

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | SIDSI gggdata/geneseqn embl/NA199.DAT:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                 The present invention relates to a method of producing extracellularly secreted, active, correctly folded, recombinant tissue plasminogen activator (tPA). Kringle 2 serine protease molecule (KS2) or their variants in prokaryotic cells by expressing the protein-encoding DNA operably linked to DNA coding for signal peptide OmpA. The method is useful for producing recombinant DNA-derived tPA, K2S or their variants Sequences of the invention are useful for manufacturing a medicament for treating stroke, cardiac infarction, acute myocardial infarction, occlusion (e.g., arteries supplying the brain), peripherally occluded arteries, coronary artery occlusion, deep vain thrombosis or related diseases associated with unwanted blood clotting. The present sequence is a supplying the occlusion of the present sequence is a supplying the occlusion of the present sequence is a supplying the prese

The invention relates to a method for producing recombinant DNA-derived heterologous protein in prokaryotic cells, where the heterologous protein is secreted extracellularly as an active and correctly folded protein and
                                                                                                                                                                                                                             the prokaryotic cell contains and expresses a vector comprising the DNA coding for the heterologous protein operably linked to the DNA coding for the signal peptide OmpA or its functional derivative. The method is useful for commercial large-scale production of heterologous proteins, e.g. K2S (kringle 2 plus serine protease), in prokaryotic cells, and is generally applicable in the expression of several different proteins and polypeptides which do not require mammalian glycosylation in prokaryotic host cells. The method may also be used to obtain DNA sequences of a protein of interest to be expressed from databases and cloned for use.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9

                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                              The present invention relates to a method of producing extracellularly secreted, active, correctly folded, recombinant tissue plasminogen activator (tPA), Kringle 2 serine protease molecule (Kr2) or their variants in prokaryotic cells by expressing the protein-encoding DNA operably linked to DNA coding for signal peptide OmpA. The method is useful for producing recombinant DNA-derived tPA, K2S or their variants. Sequences of the invention are useful for manufacturing a medicament for treating stroke, cardiac infarction, acute myocardial infarction, pulmonary embolism, any artery occlusion such as intracranial artery occlusion (e.g., arteries supplying the brain), peripherally occluded attention across across and account of the proposition of the proposition are proposed attentions.
                                                                                                                                                                                                                                                                                                                                                            9
                                                                                                                                                                                                                                                                                                                                                                       Producing active, correctly folded recombinant tissue plasminogen activator, Kringle 2 serine protease in prokaryotic cells by expressing the protein-encoding DNA operably linked to DNA coding for signal
                                                                                                                                                                                                                                              diseases associated with unwanted blood clotting. The present sequence is a DNA encoding a fusion protein comprising OmpA and K2S protein.

This flusion protein comprises an exogenous protein fused to the amino terminus of a flamentous phage pVII or pIX protein. This is useful in the design of proteins for medical,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            851
which can be used as the test reagent to detect the surface antigen recombination technique in gene engineering. The recombination technique in gene engineering. The recombination technique includes reforming the surface antigen to resist against erythrocyte and hepatitis B to become hybrid antibody genes by shortening the joining peptide of single-chain antibody, and assembling them in the same expression vector. The gene product can be directly extracted from the supernatant of bacterial culture liquid. Its advantages are low
                                                                                                                                                                                                                                                                                                                                                                                                                                                        9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel filamentous phage encapsulating a genome encoding fusion polypoptide comprising exogenous polypoptide fused to amino terminus of PVII and pIX proteins, for constructing diverse heterodimeric polypeptide array

This sequence represents the pComb3 phagemid expression vector. This vector has been designed to allow for anchoring of expressed proteins on the bacteriophage coat protein 3. Gene III of filamentous phage encodes the dof residue minor phage coat protein, cplII (cp3), which is expressed prior to extrusion in the phage assembly process on a bacterial membrane and accumulates on the inner membrane facing into the periphasm of E. coli. This plasmid was used within the scope of the invention to express various mutagenised human Fab's which comprise heavy and light variable regions which bind to HIV gp120. pComb3 allows for both surface display and soluble forms of the Fabs. The vector was designed for the cloning of combinatorial Fab libraries. pComb consists of a DNA molecule having two cassettes to express one fusion protein, Fd/cp3, and one soluble protein, the light chain. The finished vector comprises, commerce roperators equences, a spacer region, a cloning region bordered by 5' XhoI and 3' SpeI restriction site, a ribosome binding site (RBS), a PelB leader, a spacer region, a cloning region bordered by 5' XhoI and 3' SpeI restriction sites, the tether sequence, the sequences encoding bacteriophage cp3 followed by a stop codon, a Neal restriction site between the two cassettes, and a second lac2 promoter/operator cegion, a cloning region bordered by 5' SacI and 3' XbaI restriction sites, region, a cloning region control stop sequences and a second NotI restriction site. The pComb3 expression vector forms the basic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes an immunoglobin molecule or its fragment (I) comprising a region where amino acid residues corresponding to at least a portion of the complementary determining region (CDR) are replaced or fused with biologically active peptides e.g. a peptide mimetic such as an erythropoically active peptides e.g. a peptide mimetic such as an erythropoically active peptides e.g. a peptide antianaemic, haemostatic and nephrotropic activities, and can be used as a stimulator of proliferation, differentiation and maturation of haematopoietic cells, and a stimulator of haematopoiesis. (I) is useful for stimulating proliferation, differentiation or growth of promegakaryocytes or megakaryocytes, where (I) is contacted with promegakaryocytes or megakaryocytes, which results in increased platelet production. (I) with a region where amino acid residues corresponding to
                                                                           A novel immunogen molecule comprising a region in which amino acid residues corresponding to at least a portion of the complementary determining region are replaced or fused with an erythropoietin or

a portion of CDR is replaced with an EPO mimetic, or which has one or more of its CDRs fused to an EPO mimetic, is useful for increasing the production of red blood cells, where (1) is contacted with haematopoietic stem cells or their progenitors. (1) is useful for diagnostics or therapeutics, in cell isolation strategies, and for treating patients suffering from deficiency in cell populations caused by disease, disorders or treatments related to the suppression of haematopoiesis. ABQ73288 to ABQ73377 and ABPS1669 to ABPS1696 represent sequences used in the exemplification of the present invention.

                                              The present sequence is of plasmid pLR8, a pComb vector family member. pLR8 was constructed by insertion of a PCR fragment containing a flexible linker (murine kappa hinge region) followed by a Jun leucine zipper dimerisation domain into a pRL4 backbone that had been treated to remove the stuffer region. The resulting construct was then cut with restriction endomucleases to replace construct was then cut with restriction endomucleases to replace construct was then cut with restriction endomucleases to replace sector is useful in the production of biologically activity. It can also be used in the production and screening of libraries made in accordance with phage display technology. Homo-dimerisation of single chain antibodies is accomplished by the presence of the Jun leucine zipper domain, which is responsible for protein-protein interactions. Subcloning to pRU8 individually or en masse following FACS sorting or panning allows expression, e.g., of dimeric soluble Fabs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Plasmid, vector, replication, expression, foreign genetic, bacteria, cyanobacterium, Escherichia coli; pComb3X plasmid; pRL5; pRL5 asc-CAT; pRL5-CAT; pRL5 bsi-CAT; gene; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                          요
                                                                                                                                                                                                                                                                                                                                                                   ઠે
                                                                                                                                                                                                                                                                                                                          2611 Arganandacadcharcecearrecadescacrescrescrirescracerescraces
                                                                                                                                            The invention relates to a plasmid with a nucleic acid sequence of 6122, or 5683 base pairs fully defined in the specification. The invention more specifically relates to novel vectors capable of replication and expression of foreign genetic information in bacteria, such as, for example, cyanobacterium and E. coli. The new vectors have been designed to overcome certain drawbacks of the pcombax plasmid. These new vectors include pRLS, pRLS, asc. CAT and pRLS bsi. CAT. This polymucleotide sequence represents the plasmid pRLS nucleic acid sequence
                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /*tag= e

The invention relates to a plasmid with a nucleic acid sequence of 6122, 6125, or 5683 base pairs fully defined in the specification. The invention more specifically relates to novel vectors capable of replication and expression of foreign genetic information in bacteria, such as, for example, cyanobacterium and B. coli. The new vectors have been designed to overcome certain drawbacks of the pComb3x plasmid. These new vectors include pRL5, pRL5-CAT, pRL5 asc-CAT and pRL5 bsi-CAT. This sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Plasmid; vector; replication; expression; foreign genetic; bacteria; cyanobacterium; Escherichia coli; pComb3X plasmid; pRL5; pRL5 asc-CAT; pRL5-CAT; pRL5-CAT; gene; ds.

  The invention relates to a plasmid with a nucleic acid sequence of 6122, or 5683 base pairs fully defined in the specification. The invention more specifically relates to novel vectors capable of replication and expression of foreign genetic information in bacteria, such as, for example, cyanobacterium and E. coli. The new vectors have new vectors include pRLS, pRLS, arc. CAT and pRLS bsi-CAT. This polymucleotide sequence represents the plasmid pRLS bsi-CAT nucleic acid

Plasmid for in situ production of genes, comprises two template annealing sequences, such as downstream primer and upstream collar sequence and a restriction site located between the annealing sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is that of plasmid pRL5-CAT, a derivative of pComb 3X which has been modified to contain chloramphenicol resistance. The invention relates to the engineering of plasmids, of which pRL-CAT is a preferred example, for in situ production of genes. It was found that nucleic acids encoding a polypeptide can be directly incorporated into a plasmid by DNA polymerisation or by reverse transcription of a nucleic acid template. Preferably, nucleic acids encoding at least a portion of an antibody can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Lin Y, Renshaw M, Wild M;

      mRNA. The plasmids are engineered to contain 2 template annealing sequences (see ABN84079-80 and ABN84082-83), i.e. a downstream primer that anneals to a first portion of a nucleic acid template, e.g. mRNA encoding at least a portion of an antibody, an upstream collar sequence that anneals to a second portion of the template, and at least 1 restriction site located between the 2 template annealing sequences. A single-stranded DNA plasmid vector is produced containing a nucleic acid encoding at least a portion of a polypeptide, e.g. a light chain and/or a heavy chain of an antibody. This vector can be transformed into a host cell and
directly incorporated into the plasmid by reverse transcription of
                                                                                                                                                            °,

The invention relates to a plasmid with a nucleic acid sequence of 6122, or 5683 base pairs fully defined in the specification. The invention more specifically relates to novel vectors capable of replication and expression of foreign genetic information in bacteria, such as, for example, cyanobacterium and E. coli. The new vectors have been designed to overcome certain drawbacks of the pcombix plasmid. These new vectors include pRLS, pRLS-CAT, pRLS asc-CAT and pRLS bai-CAT. This polynucleotide sequence represents the plasmid pRLS CAT-Asc nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

modified version of the phagemid expression vector, promb3 given in AA092546. pho-TT provides for the expression of soluble Fabs which are secreted into the periplasmic space which is regulated from the alkaline phosphatase (phoA) promoter. This plasmid was used within the scope of the invention to express various mutagenised human Fab's which comprise heavy and light variable regions which bind to HIV gpl20. ppho-TT consists of a DNA molecule having two cassettes to express two soluble proteins a heavy chain and a light chain. The vector comprises, operatively linked 5' to 3', a first cassette consisting of the phoA promoter/operator sequences, an ECORI restriction site, a spacer region bridge site (RBS), an OmpA leader, a Sfil restriction site, a spacer region brordered by 5' saci and 3' XDaI restriction cassette consisting of an expression control RBS, a PelB leader, a human cassette consisting of an expression control RBS, a PelB leader, a human consenus amino terminus specer region comprising the sequence EVQLE.

Coloning region bordered by 5' XNoI and 3' SpaI restriction site.

Coloning region bordered by 5' XNoI and 3' SpaI restriction site.

Coloning region bordered by 5' XNoI and 3' SpaI restriction site.

Coloning region bordered by 5' XNoI and 3' SpaI restriction site.

Coloning region site. The pho-TT expression control stop sequences and a NoI restriction site.

Chain stuffer that is 1200 by in length and a heavy chain stuffer that is 1200 by in length and a heavy chain stuffer that is 1200 by in length and a heavy chain stuffer that is 1200 by in length and a heavy chain stuffer that is 1200 by in length and a heavy wail light chain stuffer seconds.

Matsumoto T,

Gene encoding Mirabilis Antiviral Protien and OmpA signal peptide for mass-prodn. of extracellular MAP

Claim 1; page 8; 15pp; English.

This Omp A signal peptide-encoding sequence is contained in a

```
recombinant plasmid, flanked on its 3' side by a Mirabilis antiviral protein (MAP) gene. The plasmid is used to transform E.coli host cells in the large-scale prodn. of MAP. The 5' end overhangs the 3' end of the complementary strand by TA and the 5' end of the complementary strand by TA and the 5' end of the complementary strand by TA and the 5' end of the complementary strand by TA and this sense
                                                                                                                                                                 strand by CTAG. See also AAQ10568.
